The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an ratinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a treat in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction,
                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 1' end genomic flanking regions, 5' or 1' end genomic flanking regions, 1' or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, num or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an office of the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine coffice or producing bronchodilation, increasing levels of ubiquinone or receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                          RESULT 468
```

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entinfilal mamatory steroid and ubiquinone. A composition may have a immunosuppressive, antiallergic, antiathmetic, hypotensive, an antianse gene therapy. The composition is useful for treating or use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an ential amatory steroid in a subject, for reducing levels of adenosine of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.
                                                                                                                                                                              ö
lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to measuring DNA-dependent DNA polymerization in a blological sample and involves measuring the amount of incorporated modified deoxynucleoside triphosphate with the aid of the label of a bound antibody. The method is useful in measuring DNA polymerization for drug susceptibility testing. Sequences ABZ75637-647 represent different templates used for second strand synthesis by HIV reverse transcriptase (RT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA polymerization; drug susceptibility; HIV; reverse transcriptase; RT;
                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Measuring DNA-dependent DNA polymerization in a biological sample, for drug susceptibility testing, comprises measuring the amount of incorporated modified deoxynucleoside triphosphate with the aid of labeled antibody.
                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 0.3%; Score 15.8; DB 1; Length 20; Best Local Similarity 89.5%; Pred. oligonucleotide containing less percentage of adenosine, targeted t nucleic acids associated with lung airway or lung dysfunction, and

bronchodilating agent

Pharmaceutical composition for treating asthma, has antisense

```
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adanosine sensitivity, levels of adenosine (A) or (A) receptors, confidence acted extractory tract inflammation allergies and reducing adenosine sensitivity. Pevels of adenosine (A) or (A) receptors, coligonucleotides are derived from a gene encoding or regulating dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery dysfunction or adding a carrier and for use of the kit. The composition of the invention has antiallergic, antialfammatory, antiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to recease the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoonstriction and/or lung inflammation, allergies as the polypeptide present in the lungs. The pulmonary disease or condition such as pulmonary vasoconstriction, and or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, respiratory distress syndrome, pain, cystic fibrosis, allergic rhintis, pulmonary transplantation rejection, pulmonary infections, bunnernt and thereby, to the allogonucleotides into products that free adenosine into the system or series. Jung, brain, heart, kidney, etc. tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 6 A; 1 C; 10 G; 3 T; 0 U; 0 Other;

This invention describes a novel composition (a) a first active agent, CC comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating control of the constitution, when administered to a mammal. The culgonucleotides are derived from a gene encoding or regulating conjugnated of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition comprises oligo and is administered to reduce the production composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to constill ammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated

```

```
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The olygonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, antisense; bronchoconstriction, allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic, antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kindey, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S

bronchodilating agent.

```
The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconstriction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
```

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configuration or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating creptoration or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery certain in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a certain a respiratory, lung or mailgnant disease. The administered containers are composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconeriction and/or lung inflammation, allergies and/or bronchoconeriction are associated containers.

inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system

e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

                                                                                                                                                                                                                    ò
                                                                                                                                                                                           The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding VEGF-C, and inhibits the expression of VEGF-C. The compound, composition and methods are useful for treating a disease or condition associated with VEGF-C, such as a cardiovascular disorder e.g. atherosclerosis or diabetic retinopathy or an autoimmume or inflammatory disorder. They are also useful in research and diagnostics for modulating the expression of VEGF-C. The present sequence represents a human VEGF-C antisense oligonucleotide.
cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding vascular endothelial growth factor-C (VEGF-C), useful for treating atherosclerosis, diabetic retinopathy, or inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human; ss; VEGF-C; cardiovascular disorder; atherosclerosis; diabetic retinopathy; autoimmune disorder; inflammatory disorder; vascular endothelial growth factor; antisense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ଚ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding VEGF-C, and inhibits the expression of VEGF-C. The compound, composition and methods are useful for treating a disease or condition associated with VEGF-C, such as a cardiovascular disorder e.g. atherosclerosis or diabetic retinopathy or an autoimmune or inflammatory disorder. They are also useful in research and diagnostics for modulating the expression of VEGF-C. The present sequence represents a human VEGF-C target region.

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid collength that target a portion of an active site on the nucleic acid collength that target a portion of an active site on the nucleic acid collength that target a portion of an active site on the nucleic acid collength actor. The present invention describes antisense collegonate a phosphorothicate linkage; at least one modified internucleoside collegonately linkage; at least one modified nucleobase, a 5-comethoyacthyl (2' MOE) and at least one modified nucleobase, a 5-comethylcytidine. These antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, collegonate, atheroscalerosis, low HDL (high density lipoprotein), high CLD (low density lipoprotein), hypercholesterolaemia, gall stones, collegonated activity, Accordingly, these compositions exhibit corrections and virucidal activities and virucidal activities and virucidal activities. This collegonated and virucidal activities and virucidal activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER /nethoxyethyl (2' MOE) nucleotides. All cytidine nucleobases are 5-methylcytidine."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /mod_base= OTHER
/note= "OTHER= 2' methoxyethyl (2' MOB) nucleotides. All
cytidine nucleobases are 5-methylcytidine."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonuclectide sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothicate linkage; at least one modified internucleoside as 2'-0-methoxyethyl (2' MOE) and at least one modified uncleobase, a 2'-0-methoxyethyl (2' MOE) and at least one wodified uncleobase, a 5-diagnosing a disease associated with LRH1, such as breast cancer, dyslipidaemia, atheroaclerosis, low HDL (high density lipoprotein), high LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                           phosphorothioate, 2' MOE; breast cancer; dyslipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; gall stone; triglyceridaemia; obesity; hepatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "OTHER= 2' methoxyethyl (2' MOE) nucleotides. triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cytostatic, antilipaemic, antiarciosclarotic, anorectic, hepatotropic, litholytic, antiliflammatory and virucidal activities. This oligonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRHI protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "This oligonuclectide has a phosphorothioate backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antilipaemic, Cardiovascular, Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyalipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are
                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of EL. The antisense oligonucleotides or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular diseased is the content of the 
                                                                                                                     Gaps
used for diagnostics, prophylaxis, or as research reagents or kits.

The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy, or atexia. The present cepresents a chimeric phosphorothioate oligonucleotide with 2.7ME wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligonucleotides are designed to target different regions of the human Navi.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to an antisense compound targeted to a suucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy, or ataxia. Including but not limited to neonatal or infantile epilepsy, or ataxia. The present but not limited to neonatal or infantile epilepsy, or ataxia. The present 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                            New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a new antisense compound, having a sequence comporising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treation; inhibiting the expression of ESM-1 in cells or tissues; and treation is useful for preparing a composition for treating diabetes, and the compound is useful for preparing a composition for treating diabetes, cardiovascular or neurological disorder. This sequence represents an entisense oligonuclectied that can be used to modulate expression of endothelial specific molecule-1 (ESM-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound, having a sequence targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), useful for preparing a composition for treating e.g., diabetes, cancer or cardiovascular

```
The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an enimal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological diabetes, antisense oligonucleotide that can be used to modulate expressine an endothelial specific molecule-1 (ESM-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound, having a sequence targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), useful for preparing a composition for treating e.g., diabetes, cancer or cardiovascular
                               gene therapy; endothelial specific molecule-1; ESM-1; ESM-1; and service disorder; diabetes; cancer; ischaemia; reperfusion injury; angiogenic disorder; immunological disorder; cardiovascular disorder; neurological disorder; antisense technology; ss.

comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridiess with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetee cancer, ischaemia or reperfusion injury, or angiogenic, immunological, candiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a new antisense compound, having a sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        // Match 0.3%; Score 15.8; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule. (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or anglogenic, immunological, earlievascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of endothelial specific molecule-1 (ESM-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound, having a sequence targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), useful for preparing a composition for treating e.g., diabetes, cancer or cardiovascular

The invention relates to the use of at least one osmolyte to heat stabilize at least one enzyme that is used in an in-vitro bioluminometric assay during the enzymatic reaction. The osmolyte is useful to heat stabilize at least one enzyme that is used in an in-vitro bioluminometric assay during the enzymatic reaction. The use of osmolytes are increases the speed and quality of DNA sequencing using Pyrosequencing (RTM) technology. This sequence represents the resultant DNA sequence obtained using the method of the invention for Pyrosequencing (RTM).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Farnesoid X receptor gene expression antisense inhibitory oligo #877.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an antisense compound 8-30 nucleobases in length where the antisense compound specifically hybridizes with and inhibits the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atherosclerosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertriglyceridemia, obesity, neurological disorders, or ischemia/reperfusion injury. In addition, the composition is used for disquasciers, prophylaxis, or as research reagents of exter. This sequence corresponds to an antisense oligonucleotide of the

The composition and methods are useful for inhibiting the expression of FXR (Parnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atheroselectoris, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertriglyceridemia, obesity, neurological disorders, or ischemia/reperfusion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides useful for modulating expression of Sarnesola K Receptor (FXR) or for treating diseases associated with FXR, e.g. diabetes, immunological disorders, cardiovascular disorders, gallstones or obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                      The invention describes a compound targeted to a nucleic acid molecule encoding endothelial differentiation gene 2. The compound, 8-80 nucleobases in length, is targeted to a nucleic acid molecule encoding cand chelial differentiation gene 2, where the compound specifically computed is a differentiation gene 2 where the compound specifically differentiation gene 2 comprising a sequence of 1576 bp (SEQ ID NO: 4) and inhibits the expression of endothelial differentiation gene 2 in method of inhibiting the expression of the endothelial differentiation gene 2; a diagnostic method for identifying a disease state; a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with endothelial differentiation gene 2; compound so that expression of with endothelial differentiation gene 2 is inhibited. The compound and intracting an animal having a disease or condition, in treating an animal having a disease or condition, i.e. hyperproliferative disorder. This sequence represents a human condition dend thelial differentiation gene 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   coding mononucleotide repeat; cMNR; antibody; MSI-H tumour;

The present invention describes genes containing coding mononucleotide repeats (CMNRB). The genes are useful for the development of an antibody gainst MSI-H (hugh microsatallite instability) tumour. Also described: (1) cDNA genes containing cMNRs with 10 or more nucleotide sequences, and selected from the cDNA genes having the nucleotide sequences of SEQ ID ST, 39, 41 and 43; (2) cDNA genes, which are framebalif mutated by the containing cMNRs with 10 or more nucleotide sequences of SEQ ID CO NOS:1, 3, 4, and 43; (2) cDNA genes, which are framebalif mutated by the genes containing cMNRs with 10 or more nucleotide sequences of SEQ ID CO NOS:2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42 and 44; and (4) genomic DNA genes, which are frameshift to mutated by deletion or insertion of one or more base in the cMNRs. The containing cMNRs with 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42 and 44; and (4) genomic DNA genes, which are frameshift to compare the present sequence represents a PCR primer which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; SCAIP; CAPN3; DYSF; calpain; calcium-activated neutral protease; limb-girdle muscular dystrophy type 2A; LGMD2A; dysferlin; limb-girdle muscular dystrophy type 2B; LGMD2B; PCR; primer; SS; Single Condition Amplification/ Internal Primer.

                                                                                                                                                                                                                                                                                                                                                                            유
                                                                                                                                                                                                                                                                                                                                            ਨੇ
                                                                                                                                                                                                                                             The present invention relates to a single Condition Amplification/
Internal Primer (SCAIP) sequencing method for direct sequence analysis of
Internal Primer (SCAIP) sequencing method for direct sequence analysis of
In multi-exon genes from genomic DNA samples and identifying mutations
in multi-exon genes e.g. the dystrophin gene, CAPN3 gene and DYSF gene.
Whitations in the dystrophin gene, CAPN3 gene and DYSF gene.
Whitations in the dystrophy (BMD). Mutations in the
CAPN3 gene, encoding calpain (calcium-activated neutral protease) result
in limb-girdle muscular dystrophy type 2A (LGMDZA) and mutations in the
DYSF gene, encoding dysferlin, result in limb-girdle muscular dystrophy
CC type 2B (LGMDZB). The method comprises bringing into contact in each of
the reaction chambers an amplicon from a different one of the
amplification reactions and one or more internal sequencing primers
corresponding to the amplicon and analysing the sequences of the
amplifications The method allows for the rapid, accurate, and economical
analysis of any large multi-exon gene. The method is useful in detecting
genetic mutations in any large multi-exon gene. It is also useful for the
including deletions, point mutations, or its combinations, gene complexes
with multiple exons/introns apanning large genomic regions. The present
ce sequence is a PCR primer, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to two isolated cDNA molecules ([pASC6] and (pACOS7)) encoding 1-aminocyclopropane-1-carboxylic acid synthase (ACS) and an ethylene forming enzyme (EFE), respectively. The clones are deposited under the Accession Numbers NCIMB 40813 and NCIMB 40814, respectively. pASC6 and pACOS7 may be used to genetically control processes involved in fruit ripening (and other ethylene related processes involved in fruit ripening (and other ethylene related processes). Vectors comprising the cDNA sequences may be used to produce transgenic banamas with altered fruit ripening characteristics. The orientation of the pASC6 and pACOS7 used in the construct, will determine how the ripening process is affected. If the genes have a sense
                                                                                                                                          PCR primers AAV37276-77 are used to amplify the constant region of the heavy chain of human immunoglobulin G (IgG). The PCR product is used to create an anti-Fes antibody. The anti-Fes antibody can be used for the treatment and diagnosis of autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1-aminocyclopropane-1-carboxylic acid synthase; ACS; EFE; banana; ethylene forming enzyme; ethylene biosynthesis; plant; fruit ripening; transgenic; enzyme; inhibition; flavour; texture; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                    Gaps
                                           DNA encoding, e.g. variable region of anti-Fas antibody - useful for, e.g. diagnosis and treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated cDNA molecules ((pASC6) and (pACOS7)) encoding 1-aminocyclopropane-1-carboxylic acid synthase (ACS) and an ethylene forming enzyme (EFE) - useful for modifying fruit ripening

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their mucleotide sequences. AAZ6579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping of the which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the discalous responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                       ö
orientation, and transcribe mRNA that encodes an active enzyme, the rate of ripening will be increased (up-regulation) (however, full-length sense constructs can also be used to inhibit enzyme expression by coninhibition). If genes encode antisense mRNA, they will inhibit the expression of the genes involved in fruit ripening and hence slow the process down (down-regulation). In this manner different spatial and temporal patterns of genes expression can be produced. Retardation of the zete of ripening will reduce the rate of deterioration of banana fruit after harvest. This helps in production of high quality fruit that has improved flavour and texture. Sequences AAX27517-531 represent primers based on sequences conserved between 6 species, for PCR amplification of EFE gene fragments from bananas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel biallelic markers used to construct a high density disequilibrium map of the human genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human biallelic marker downstream amplification primer SEQ ID NO:8727.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the use of a polypeptide (ABB44544-ABB44601, ABB44664-ABB44623) or its variant or encoding nucleic acid (ABA81990-ABA81995, ABA82016-ABA82032) with vulnerary and/or dermacrological activity for the diagnosis, prevention and treatment of skin disorders and treatment in wound healing or for the identification of pharmacologically active substances. The nucleic acids are useful in gene therapy. The present sequence is that of a PCR primer, useful to the invention. Note: The printed sequence listing for this specification was incomplete, terminating part way through SEQ ID NO 106. The remaining data was obtained from EPO data for an equivalent patent (EP1114862)

The sequence represents PCR primer #4 from avocado used to design a degenerate PCR primer, BEFE-5 (AAS09924) which was used to clone ethylene -forming enzyme (BFE) from banana, used in the method of the invention.

The method involves modifying the level of ethylene biosynthesis in a plant of the genus Musa by inserting into the genome of the plant a DNA sequence (I) encoding a banana 1-aminocyclopropane-1- carboxylic acid synthase (ACS) or an ethylene-forming enzyme (BFE), where (I) is in sense or antiennse configuration, and modifies the level of activity of ACS or EFE. This retards the rate of ripening in banana fruits which reduces the care of deterioration of banana fruit after harvest. As a result, fruit may be harvested when they have reached partial or full ripeness and still have the robustness to withstand handling and transport to reach the consumer in good condition. In this way high quality ripe fruit can be made available to the consumer with reduced requirement for post.

Charvest treatment. High quality fruit will have improved flavour and texture. High quality fruit can be produced consistently over a wide the consumer the consumer with reduced negativement for post.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modifying level of ethylene biosynthesis in plant of genus Musa, involves inserting into genome of plant a DNA sequence encoding banana 1-aminocyclopropane-1-carboxylic acid synthase or ethylene-forming enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gape

                                                                                                                                                                                                                                                                                                                                                                                                             DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in an east of a pharmaceutical should be correlation, forensics, paternity testing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Endothelin; EDN; endothelin converting enzyme; ECE; endothelin receptor; EDNR; signaling system; cardiovascular disease; coronary heart disease; hypertension; atherosclerosis; angiogenesis; fatty acid metabolism; diabetes; familial hypercholesterolaemia; forensic marker; transgenic animal; solid support; cardiovascular regulator; SNP; single nucleotide polymorphism; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                               New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.

The invention describes a polymucleotide (I) of the endothelin (EDNR) (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) (CC signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing a molecular variant gene comprising (I) is useful for identifying and conclusion as pro-drug or drug capable of modulating the activity of a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of the EDN/EDNN/ECE signaling system cor its gene product, or for identifying and obtaining an inhibitor of the cativity of a molecular variant of a polypeptide of the EDN/EDNN/ECE signaling system or its gene product. The isolated proteins and cortivate comprision them are useful for preparation of a polymorleotides encoding them are useful for preparation of a polymorleotides encoding them are useful for preparation of a polymorleotides encoding them are useful for preparation of a polymorleotides composition for treating a cardiovascular disease such as polymorleotides and in the EDN/EDN/EDN signaling system are useful as forensic markers, for comportant angiogenesis or fatty acid metabolism e.g. diabetes and familial cortivals are repulsation of a solid support coreating a transgenic animal and in creation of a solid support corpusing polymorleotides, genes vectors, polypeptides, antibodies or comprising polymorleotides, genes vectors, polypeptides, artibodies or cardiovascular regulator prote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Endothelin; EDN; endothelin converting enzyme; ECE; endothelin receptor; EDNR; signaling system; cardiovascular disease; coronary heart disease; hypertension; atherosclerosis; angiogenesis; fatty acid metabolism; diabetes; familial hypercholesterolaemia; forensic marker; transgenic animal; solid support; cardiovascular regulator; SNP; single nucleotide polymorphism; PCR; primer; ss.

The present sequence is a PCR primer for murine alpha 1-antichymotrypsin (ACT) cDNA (see ABV76143). It was used, with the primer given in ABV76148, in examples from the invention describing the PCR amplification of murine ACT to examine expression in normally healing, well healing and 3 different types of poorly healing wounds with different pathogenic backgrounds, and to examine the kinetics of ACT expression during wound healing in healthy and diabetic mice. The invention is based on the discovery that decreased expression of ACT is causally involved in poor wound healing specifically in poorly healing diabetes-associated and poorly healing arterial wounds. An ACT polypeptide, including murine ACT, an uncleic acid encoding it, or a cell expressing the ACT polypeptide or nucleic acid encoding it, can be used for the diagnosis, treatment and/or prevention of diabetes-associated and/or exterial wounds which heal
                                                                                                                                                                                                                                                                                                                                                       Use of alpha 1-antichymotrypsin polypeptide or nucleic acids encoding the polypeptide, or of a cell expressing the polypeptide, or of antibody against the polypeptide, for diagnosing, treating or preventing poorly-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            poorly. The wound may be a diabetic ulcer or an arterial ulcer, and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a polynuclectide (I) of the endothelin signal converting enzyme (BCB)/receptors of EDN and ECE (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) or (III) is useful for producing cells capable of expressing a molecular variant polypoptide which is associated with a cardiovascular disease. (II), (IIII), the EDN, ECE or EDNR polypoptide, or a cell expressing a molecular variant gene comprising (I) is useful for identifying and obtaining a product, or for identifying or inhibitor of a molecular variant of a polypoptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying an inhibitor of the cell variant of a molecular variant of a polypoptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and polynucleotides encoding them are useful for preparation of a polypoptical composition for treating a cardiovascular disease such as conmary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial EDN/ECE, EDNR signaling system are useful a for engagenet of the EDN/ECE, EDNR signaling system are useful as formator markers, for creating a transgenic animal and in creation of a solid support composition phynucleotides, genes, vectors, polypeptides, antibodies or boat creating a personance or is sense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                     The present sequence is that of a 5' primer, which was used with the 3' primer given in ACCS8763 for the PCR amplification of the pro-alphal(III) chain. The PCR product was used to prepare a DNA molecule (see ACCS8766) encoding a modified pro-alpha chain (see ABR42661) in which decorin replaced the globular domain of the N-propeptide of the pro-alphal(III) chain. This is an example of modified pro-alpha chains of the invention that may form part of a procollagen molecule for incorporation into collagen polymers, matrices and gels used to treat wounds and fibrotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to measuring DNA-dependent DNA polymerization in a biological sample and involves measuring the amount of incorporated modified deoxymucleoside triphosphate with the aid of the label of a bound antibody. The method is useful in measuring DNA polymerization for
                                                                            Novel modified pro-alpha-chain useful for treating wounds and fibrotic disorders, has triple helical forming domain linked to N-terminal domain that contains a polypeptide sequence from proteoglycan protein core.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA polymerization; drug susceptibility; HIV; reverse transcriptase; RT;

The present invention relates to a method (M1) for selecting an animal comprises testing the animal for the presence of a nucleic acid comprises testing the animal for the presence of a nucleic acid comprises testing the activity of an evolutionary conserved CpG modification affecting: the activity of an evolutionary conserved CpG island located in intron 3 of an IGP2 gene; and/or binding of a nuclear factor to an IGP2 gene. The nuclear factor is capable of binding to a stretch of nucleotides which in the wild type pig, mouse or human IGP2 gene is part of an evolutionary conserved CpG island, located in intron 3 of the IGP2 gene. The stretch is functionally equivalent to (ADQ80709). Cof the IGP2 gene. The stretch is functionally equivalent to (ADQ80709). Cof the nucleic acid modification in ADQ80709 comprises a G to A transition CC The nucleic acid modification in ADQ80709 comprises a G to A transition CC The nucleic acid muscle mass, fat deposition, and/or teat number. CT properties related to muscle mass, fat deposition, and/or teat number. CT properties related to muscle mass, fat deposition, and/or teat number. CT GF2 gene by modulating the activity of an evolutionarily conserved CpG island located in intron 3 of an IGP2 gene and/or modulating binding of an IGP2 gene and a method (M4) for identifying a compound capable of modulating binding of a nuclear factor to an IGP2 gene in a cell or organism. CT for modulating mRNA transcription of an IGP2 gene and a method (M4) for identifying a compound capable of modulating binding of a nuclear factor to an IGP2 gene in a cell or organism.
                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Selecting an animal for desired genotypic or potential phenotypic properties such as muscle mass and/or fat deposition, comprises testing for a single nucleotide polymorphism in intron 3 of the IGF2 gene.
drug susceptibility testing. Sequences ABZ75637-647 represent different templates used for second strand synthesis by HIV reverse transcriptase (RT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anorectic, Antidiabetic, Muscular, Gene Therapy; CpG island;

ö
(M3) and (M4) are useful for identifying compounds capable of modulating mRNA transcription of an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene. Compounds identified are potentially useful for trating obesity, muscle deficiencies and diabetes. The present sequence is a primer which was used to produce porcine sequence tagged sites (STS) in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 88; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOG0; hammerhead ribozyme; DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; Muman immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopsenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.

CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH mocif), a G-cleaver (cleaving RNA with an NGN riplet), a zinzyme (cleaving RNA with an NGN riplet), a zinzyme (cleaving RNA with an NGN riplet), a zinzyme (cleaving RNA with a VGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CC coll in the presence of a divalent cation that is preferably Mg<sup>2</sup> +.

CC fCD20 in the presence of a divalent cation that is preferably Mg<sup>2</sup> +.

CC fULC) The treatment may further comprise the use of one or more conformation the capies. In particular, by further comprise the use of one or more conformation in a lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-treat lymphoma (MCL), immunotycoma (IMC) small B-cell lymphocytic lymphocytic lymphocytic lymphoma, immunocytopaenia, and inflammatory arthropathy. The NGGO-cell lymphoma, immunocytopaenia, and inflammatory arthropathy. The NGGO-ct targetting nucleic acid is used to clearably Mg<sup>2</sup> 2+. Furthermore, the contacted with a cell to reduce NGGO activity of the presence of a divalent cation that is preferably Mg<sup>2</sup> 2+. Furthermore, the contacted with a cell to reduce NGGO activity of the contacted with a confittion associated with the level of contacted with a confittion associated with release to therapies. In particular, the NGGO-targetting nucleic acid may be used to treat centural nervous system (CNS) injury and cerebrooascular a centural nervous system (CNS) injury and cerebrooascular acident (CNS) injury and cerebrooascular acident (CNS, stroke), Alzheimer's disease, dementia, multiple sclerosis (ALS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, muscular dystrophy, and/or other neurodegenerative disease cerebroops and relaxia, Huntington's disease, creates which respond to the modulation of NGGO expression. The present contacted ribozyme of the invention

```
The invention relates to a nucleic acid molecule which down expression of a CD20 gene and a nucleic acid molecule which down expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The could be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NCH motif), a G-cleaver (cleaving RNA with a NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA compared to the cell and treat a patient having a condition associated with the level cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more creat lymphoma, leukaemia, B-call lymphoma, low-grade or follicular NGO-cleave NMI, low-grade or follicular nontraction and inflammatory arthropathy. The NOGO-cleave RNA of the NOGO gene in the creatment and further comprise the use of one or more compared in mucleic acid may be used to cleave RNA of the NOGO gene in the creatment may further comprise the use of one or more collicular, the NOGO-the treatment may further comprise the use of one or more collicular, the NOGO-the treatment may further comprise the use of one or more collicular, the NOGO-the use of one or more collicular, the NOGO-the motified acid and because, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral aclerosis (MS), chemotherapy-induced neuropathy amyotrophic lateral

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 81; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a rubcited and north motif), a G-cleaver (cleaving RNA with a NTM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NTM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NTM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a TWN motif) proposessing an NCH motif) and a G-cleaver (cleaving RNA with a TWN motif) proposessing an NCH motif, a G-cleaver (cleaving RNA with a TWN motif) proposessing an NCH motif of CD20-targeting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably MG²+. Cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of fone or more loakachis land proposes (NRL), bulky low-grade or follicular NHL, lamphocytic languation (NRL), bulky low-grade or follicular NHL, lamphocytic largeting nucleic acid may be contacted with a cell to reduce NGO gene in the presence of a divalent cation that is preferably MG²+. Furthermore, the presence of a divalent cation that is preferably MG²+. Furthermore, the contacted with a cell to reduce NGO activity of the coll and treat a patient having a condition associated with the level of NGO. The treatment may further comprise the use of one or more therapies. In particular, the NGO-tayetting nucleic acid may be used to the presence of a divalent cation that is preferably MG²+. Furthermore, the NGO-therapies in material mervous system (CNA) injury and ceatebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyore disease, cataia, Huntington's disease, cataia, Huntington's disease, cataia, Hu sequence is an inozyme of the invention

```
New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                   Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ss.
                                                                        Murine oligonucleotide associated with tumour supression, SEQ ID 2382.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 309; 738pp; French.

The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoprosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in virco as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                            fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant polypeptides, and to prepare transgenic animals, as recombinant polypeptides, and to prepare transgenic animals, as caperimental models. The nucleotides (laso vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or viral degeneration (e.g. Alzheimer's disease or schizophrenia).

Chalysis of the expression of the nucleotides can be used for diagnosis and the containing the vectors when the containing the vectors or all degeneration (e.g. Alzheimer's disease or schizophrenia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, 88; primer; probe, tumour suppression, tumour reversion, apoptosis; virus resistance, transgenic animals, Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal

The invention relates to the isolation of 6327 mucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the sequence having at least 80% identity, after optimal alignment, with the sequence that hybridizes under stringent conditions with the uncleotides, or the complement, or corresponding RNA, of the nucleotides or the nucleotides are used as probes or primers for detecting, of annitifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour corpuspations or reversion, apoptosis and or viral resistance, to produce experimental models. The nucleotides (also vectors containing the mand corpuspatides and on thouse calls containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or call degeneration (e.g. Alzheimer's disease or schizophrenia).

Corporations or diseases the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides can be used for diagnosis also be used to screen for their specific interactive molecules, the containing diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      reproductive maturation regulator; imago; diapause inducer; diapause inhibitor; larva; transformation regulator; pupa; juvenile hormone acid transmethylase; allkworm; Bombyx, mori; bnosophila melanogaster; mosquito; Anopheles gambia; Spodoptera litura; Helicoverpa armigera; molting; transformation; diapause; blastogenesis; polymorphism; arthropod; cotton bollworm; PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 515
```

```
The invention relates to a DNA (I) encoding a protein (II) having juvenile-hormone acid transmethylase activity selected from the DNA from silkworm (Bendbyx mori), Drosophila melanogaster, mosquito (Anopheles gambiae), Spodoptera litura and Helicoverpa armigera, their encoded proteins (S2), DNAs (D2) that hybridize under stringent conditions with the nucleic acids or an amino acid sequence (S3) comprising any one of (S2) in which one or more amino acids are substituted, deleted, inserted and/or added. (I) is useful for screening a compound that controls the expression level of (I), and as a controlling agent of molting and transformation, reproductive, diapause, blastogenesis, action, polymorphism or lifetime of arthropod. (II) is useful for screening a compound having binding affinity with respect to (II), which involves contacting test compound that controls the binding of (II) which involves useful for screening a compound that controls the activity of involves contacting test compound with (II), measuring the activity of (II), and selecting the compound with (II), measuring the activity of (II), and selecting test compound with (II), measuring the activity of (II), and selecting test compound with (II), measuring the activity of (II), and selecting test compound that decreases or increases the activity of (II), and selecting the compound that decreases or increases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of (II), based on comparison of the activity of (II) in absence of test compound. (II) is useful for manufacturing activated juvenile hormone. This sequence corresponds to a PCR primer used to amplify and isolate the transmethylase cDNA from the silkworm Bombyx mori.
                                                                                                                                                                                                                                                     New DNA encoding protein having juvenile-hormone acid transmethylase activity, useful for screening for a compound controlling the expression level of juvenile-hormone acid transmethylase DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Osteocalcin; osteonectin; osteopontin; bone morphogenic protein; BMP; parathyroid hormone receptor; alkaline phosphatase; procollagen; human; osteoblast precursor cell; OPC; bony defect; osseous defect; traumatic bone loss; congenital insufficiency; malformation; osteoporosis; surgical resection; traumatic avulsion; PCR primer; ss.

defects comprising a porous matrix and a cell that is committed to an osteogenic lineage. The composition is useful for healing a bone defects, especially those caused by osteogenical lineage. The composition is useful for healing a bone defects, especially those caused by osteogenical lineage. The compositions assist in the repair and regeneration of bone. Osteoblast compositions assist in the repair and regeneration of bone. Osteoblast individual where OPC's are numerically deficient or functionally impaired. OPC's can be administered to express BMP to repair bone defects. The implant is useful for promoting vascular ingrowth and bone composition, especially in treating bone defects e.g. osteopenic spine. The composition promotes vascular ingrowed bone formation without becoming a barrier to the progression of bone formation. Opc's can be gently introduced into the cavity without disrupting the cells in the suspension and they also encourage additional bone formation in the surpension and they also encourage additional bone formation in the surpension and they also encourage additional bone formation in the surpension and they also encourage additional bone formation in the surpension and they also encourage additional bone formation in the surpension and they also encourage additional bone formation in the surpension and they also encourage formation in expression of the present sequence represents a reverse transcription of the present sequence represents a reverse transcription of the present sequence represents a reverse transcription and they also account to the present sequence represents a reverse transcription are sequenced to present sequenced to the presen

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
gene encodes an antigenic polypeptide, which is used to derive formulae for KSHV epitopes that are recognised by CD8 T cells. Polypeptides comprising the epitope are useful for producing a vaccine against KSHV. They are also useful for stimulating dendritic cells or T lymphocytes ex

                                                                                                                                                                                                                        The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19. The markers are useful for genotyping or assimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disease involving drug responses, obesity or disorders related to obesity, such as hypertricaemia, digestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertrenation, hypertlipidaemia, insulin disorders, atheromatous disease and cardiac insufficiency. The markers are useful for detecting a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker haplotype and a phenotype and/or between a biallelic marker haplotype and a phenotype and marker
                                                                  Set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19, useful, for e.g. detecting statistical correlations between marker allele and a phenotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides and expression vectors with an epitope sequence recognized by a CD8 T cell, useful in the manufacture of a vaccine for the prophylactic and/or therapeutic treatment of Kaposi's sarcoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Epitope; KSHV; CD8 T cell; vaccine; dendritic cell; T lymphocyte; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primers ABZ77709-10 used in a nested PCR reaction to amplify fragments of the K1 gene of Kaposi's sarcoma herpesvirus (KSHV). The invertical describes a raw interiestric (intal) again (in comprising a genee sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequence and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apos-100 levels or glucose-6-phosphates levels in a subject, producing (I); the producing one or more asymmetrical modification in the sequence, where the modification decreasing (I), involves selecting a sequence with activity and control one or more asymmetrical modification in the sequence, where the modification decreasing (I) and instruction for its use; and a device the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device the capturing apos-100 levels or glucose-6-phosphates levels. (M1) is useful for reducing apos-100 levels or glucose-6-phosphates levels. (M2) is useful for reducing apos-100 levels or glucose-6-phosphates levels. (M3) is useful for reducing apos-100 levels or glucose-6-phosphates levels. (M3) is useful for reducing apos-100 levels or glucose-6-phosphates levels. (M3) is useful for otherwise unwanted expression of apos-100, elevated or otherwise unwanted disorder is chosen from the HDL/LDL cholesterol imbalance, disorder is chosen from the HDL/LDL cholesterol imbalance, dyslightedmisa, hypercholesterolaemia, coronary attery disease (CM3), oconary hart companies. (C1) is useful for related disorder e-g. diabetes or type-2 diabetes or treating the diseases as mentioned above, cancer (e-g. breast, co

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have con sor more asymmetrical 2'-O alkyl modifications, the antisense cone or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaccutical preparation comprising (I); reducing (M1) apos-100 stabilising or glucose-6-phosphatase levels in a subject; producing (I); crabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is a useful for reducing apos-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apos-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apos-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apos-100 levels or glucose-6-phosphatase levels. (M2) is useful for reducing apos-100 levels or glucose-6-phosphatase levels. (M3) is useful for seducing apos-100 levels or glucose-6-phosphatase levels. (M3) is useful for cherwise unwanted expression of apos-100, elevated or otherwise unwanted expression of apos-100, clevated or otherwise unwanted cyclosterolesterolasma, acronary artery disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism. Colonary heart colonary artery disease (HD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-ended or otherwise unwanted disease (HD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucoses or craating the diseases as mentioned above, cancer (e.g. presented and presented and presented or 
                                                                                                                                                                                                                                                                                                                                                                          Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gape

New antisense compounds targeting nucleic acids encoding human P13 kinase
p110 delta useful for treating a disease or condition associated with P13
                                                                                                                                                         Forward primer 3F (AAT45687), which incorporates a 5' BamHI site, and reverse primer 3R (AAT45688), which carries HindIII and PstI sites, were used for the PCR amplification of a 685 bp fragment of the N-terminal portion of the urease subunit B (UreB) gene (excluding the ATG codon) of Helicobacter felis (see also AAT45680). This was used with a previously obtd. UreB fragment in pILL219 to obtain a clone capable of synthesising cloned into pWAL to allow prodon. of UreB as a maltose binding protein fusion in E. coli. UreB can be used in novel compsns. for the treatment and prevention of Helicobacter infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Optionally 2'-methoxyethyl (2'-MOE) nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleotides"
New immunogenic compsn. contg. UreB and HspA antigens of Helicobacter for treatment and prevention of esp. H pylori infection, also new antibodies specific for these antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phosphatidyl inositol 3 kinase; P13K; antisense oligonucleotide; P110 catalytic subunit; treatment; rheumatoid arthritis; asthma; research; diagnostic; infection; inflammation; tumour formation; inhibitor; ss.

This sequence represents a phosphatidyl inositol 3 kinase (PI3K)
targeting antisense oligonucleotide. Phosphatidyl inositol 3 kinases act
as downstream effectors of hormone and growth factor receptors, and have
been implicated in growth factor mediated cell transformation, and
mitogenesis, protein trafficking, cell. Survival and proliferation, and
mitogenesis, protein trafficking, cell. Survival and proliferation, and
cell any other cellular activities. PI3K is a heterodimer, consisting of a
llokD catalytic subunit (pl10), and an 85kD regulatory subunit (p85). The
invention relates to antisense oligonucleotides which target the pl10
cell any various regions of the PI3K mRNA sequence, and inhibit the
cexpression of PI3K. The antisense oligonucleotides may be used to treat
a naimal, particularly human, suspected of having or being prone to a
disease or condition associated with the expression of P13K. The
modulation (preferably inhibition) of the expression of P13K. The
modulation (preferably inhibition) of the expression of P13K. The
coll architical compositions and formulations, in the preparation of
kits for detecting the level of P13K in a sample, and as prophylaxis,
cell to prevent or delay infection, inflammation or tumour formation.
Antisense oligonucleotides, which are able to inhibit gene expression
specifically, are used to elucidate the function of particular genes, and
construction of particular genes, and
constructions of various members of a biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A novel protein associated to hereditary spastic paraplegia used for the diagnosis of neurodegenerative conditions.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haploryping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

                                  The present sequence is a forward primer aa2 used for amplification and detection of mutations in paraplegin gene exon from hereditary spastic paraplegia (HSP) patients. Detection of mutations in paraplegin gene helps in the diagnosis and treatment of various forms of HSP or other neurodegenerative conditions, such as Amyotrophic Lateral Sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel biallelic markers used to construct a high density disequilibrium

The invention relates to a novel isolated or recombinant mucleic acid compensation an AWGE, CLLD8 or CLLD7 mRNA, or ANGE-CLLD8, ANGE-CLLD7, CLLD7, CLLD7, CLLD7, CLLD7, CLLD7, CLLD7-CLLD8, or ANGE-CLLD8 -CLLD7 hybrid mRNA sequence, its complement, homologue or fragment. The novel nucleic acid sequences have the following activities: antiallergic, antiatheric, dermatological, antipyretic, and antiniflammatory. The nucleic acids of the invention may consider in gene therapy to treat disorders The nucleic acid sequences are useful for screening agents that inhibody is useful for treating CANGE, CLLD8 or CLLD7 gene. The agent or antibody is useful for treating considered in an assay detecting or measuring the polypeptide in the sample. The host cell is useful for producing, regulating and analyzing the collypeptide. The splice variant of ANGE, CLLD8, or CLLD7; is useful for producing asthma, acopy, a form of atopic disease or collypanes. The splice variant of ANGE, CLLD8, or CLLD7; is useful for non-atopic asthma, or predicting the severity, or predisposition to a con-atopic asthma, or predicting the severity, or predisposition to a semmilification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid sequence comprising an ANGE, CLLD8 or CLLD7 mRNA, or their hybrid, useful for screening agents for treating IgE-mediated diseases, e.g. asthma, atopy, hay fever, eczema, atopic dermatitis, or allergic rhinitis.
                                                              ANGE, CLLD8; CLLD7; ANGE-CLLD8; ANGE-CLLD7; CLLD7-CLLD8; ANGE-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD8-CLLD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new compound which is targeted to a nucleic acid molecule encoding RECQL5 and hybridises with and inhibits the expression of RECQL5. The compound is useful for preventing or tracting an animal having a disease or condition associated with RECQL5 e.g. tumour or inflammation. The present nucleic acid sequence represents a human RECQL5 mRNA inhibition oligonucleotide of the invention
                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A compound, which hybridizes with and inhibits the expression of RECQL5 gene, useful for preventing or treating an animal having a disease or condition associated with RECQL5 e.g. tumor or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human RECQL5 inhibition chimeric phosphorothioate oligonucleotide #51.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense compounds targetted to a nucleic acid encoding thyroid hormone receptor interactor 6 (TRIP6) to inhibit its expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (ZRP-1). TRIP6 DNA is located on chromosome 7q22. Antisense compounds of the invention are useful for modulating the expression of TRIP6 and for treating diseases or conditions associated with the expression of TRIP6 such as hyperproliferative disorders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as tresearch reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is an antisense oligo targetted to human TRIP6 DNA. This oligo is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides targeted to nucleic acids encoding thyroid hormone receptor interactor 6, useful for diagnosing or treating hyperproliferative disorders, such as cancer.
                                                                                                                                                                           /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"

The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense oligonucleotide; glucocorticoid receptor; infection; finfiammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2 -methoxyethy1; 2 -MOE.

```
New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "This oligonuclectide has a phosphorothioate backbone and 2-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; {\rm HDL}_{\circ} cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                         The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically Mybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotide for modulating endothelial lipase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human endothelial lipase antisense oligonucleotide, SEQ ID 1313.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                       The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOB) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "This oligonucleotide has a phosphorothioate backbone and 2-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present
expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound targeted to a nucleic acid molecule encoding abav. 3, useful for useful for treating a disease or condition associated with Navl. 3, e.g. pain, selzure disorder such as childhood seizure disorder, or ataxia.
                                                                                        The present invention relates to antisense oligonucleotides (AbJ21603-AbJ25510) targeted to human Endothelial Lipase (EL) coding sequence (AbJ25517), where the antisense oligonucleotide specifically Mybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention relates to an antisense compound targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric phosphorothioate oligonucleotide to target Navl.3 #8377.
                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an antisense compound targeted to a mucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonuclectide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound targeted to a nucleic acid molecule encoding about.3, useful for useful for teating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOS wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.

                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an isolated nucleic acid with cytostatic action named cancer related gene-Liver 2 CRG-LZ. The polynucleotides and polypeptides are useful in diagnosing and treating cancer, e.g. breast, kidney, colon, preferably liver cancer. The present sequence represents a primer of the invention.

The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atherosclerosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertisjyceridemia, obesity, hypercholesterolemia, gallstones, hypertisjyceridemia, obesity, environgence in used for diagnostics, prophylaxis, or as research reagents or setts. This sequence corresponds to an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antidiabetic; immunosuppressive; cardiovascular; antilipemic; antiarteriosclerotic; heparotropic; litholytic; anorectic; neuroprotective; vasotropic; antisense; gene therapy; Farnesoid X receptor; diabetes; immunological disorder; cardiovascular disorder; dyslipidemia; atherosclerosis; high density lipoprotein; low density lipoprotein; low density lipoprotein; hypercholesterolemia; schemia; reperfusion; diagnostics; prophylaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides useful for modulating expression of Farnesoid X Receptor (FXR) or for treating diseases associated with FXR, e.g. diabetes, immunological disorders, cardiovascular disorders, gallstones or obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Farnesoid X receptor gene expression antisense inhibitory oligo #1053.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                      The invention relates to an antisense compound 8-30 nucleobases in length where the antisense caid molecule encoding Parnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atherosclerosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertriglyceridemia, obesity, neurological disorders, or ischemial/reperfusion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tyrosine kinase; cancer; anti-cancer agent; signalling molecule; tumourigenesis; somatic alteration; colorectal cancer; NTRK3; FES; GUCY2F; MCCK; MLK4; kinase domain; cytostatic; tyrosine kinase inhibitor;
                                                                                                                                                          New antisense oligonuclectides useful for modulating expression of strnesoid X Receptor (FXR) or for treating diseases associated with FXR, e.g. diabetes, immunological disorders, cardiovascular disorders, gallscones or obesity.

```
This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for tunci-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NYRK3, PES, GUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase activity atimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a human-derived oligonucleotide
                                                                                                                                                        MCCK) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #49
                                                                                                                                                    Activated mutant protein tyrosine kinases (e.g. NTRK3, FES and MCCK) arassociated methods for diagnosing cancer and screening for anti-cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer, Chedlak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

                                                                                                                                                                                                                                                                                                          ð
                                                             The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically the plso. The compound is an antisense oligonucleotide that specifically the propriet and inhibite expression of the polypeptide. The antisense companies at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are uncleobase comprising the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancel), Chediak-Higashi syndrome, neurodegenerative disorders and cancellic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence in represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, plso The compound is an antisense oligonucleotide that specifically plso the compound is an antisense oligonucleotide that specifically the plso and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of Filsk regulatory subunit 4, plso useful for modulating or treating hyperproliferative disorders and cancer). Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a Pl3K regulatory subunit 4, plso DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```

```
This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-tknase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified agast molety, preferably a 2-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified on the sead in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory cubunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 5 A; 3 C; 4 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for gene therapy

Freier SM, Dobie KW;

WPI; 2004-282523/26.

New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chedlak-Higashi syndrome or a metabolic disorder.

Example 15; SEQ ID NO 127; 60pp; English.

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-krimase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage,

preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide be used prophylada s-methylcytosine. The antisense oligonucleotide be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used for gene therapy.
